This sequence represents the tomato RNA-directed RNA polymerase (RdRP) protein of the invention. The invention comprises the nucleic acid and protein sequences of RGRP. The protein of the invention can catalyse in vitro transcription of short single stranded RNAs into DNA molecules, this transcription can be either primed by RNA or DNA oligonucleotides the uprimed. The protein may have cytostatic or vitrucide activities. The sequences of the invention may be used in gene therapy or as an RNA disease are useful for treating disease caused by the undestred adisease are useful for treating a disease caused by the undestred expression or overexpression of a nucleic acid molecule which causes a disease are useful for treating the molecules. This system can be used in the preparation of a pharmaceutical composition and for inhibiting expression of any desired gene by transferring the RdRP system to expression of any desired gene by transferring the RdRP system to cryptism that either lack a comparable mechanism or do not sufficiently expression of any desired gene expression in transgenic organisms.

The sequence is useful for inhibiting RNA directed RNA synthesis and for ensuring stable heterologous, gene expression in transgenic organisms. The sequence is useful for inhibiting RNA directed RNA synthesis and for expression, as primers for amplification of the control of gene expression of undesired gene expression in humans and animals. The RdRP is useful as a therapeutic agent for the control of cancer and virus infection in humans and animals and animals and inmunoprecipitation or immunologalisation of the protein, identification immunoprecipitation or immunologicalisation of the protein sequences are useful as a charapeut or immunological protein sequences are useful for immunological protein
                                                                                                                                                New nucleic acid molecule encoding a polypeptide having the enzymatic activity of RNA-directed RNA polymerase, for modulating gene expression and treating cancer and virus infection in human and animals -

This protein is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RdRP nucleic acid is useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or morphological changes. Transgenic plants containing. RdRP nucleic acid is especially useful in plant cell or tissue containing and in plant breeding. RdRP is useful in gene therapy, particularly for treating a disease that is caused by the undesirable expression or
                                                                                                                                                                                                                                                                        New nucleic acid molecules encoding polypeptides with RNA-directed RNA polymerase enzymatic activity, useful in modulating gene expression in plants, humans and animals, as well as in plant cell/tissue cultures or plant breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

                                                                                                                                                                 The present sequence is tomato RNA-directed RNA polymerase 800 (RdRPB00) protein which corresponds to position 700-917 of C-protein. C-protein is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RdRP nucleid as useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or morphological changes. Transgenic plants containing RdRP nucleic acid is especially useful in plant cell or tissue cultures and in plant breeding. RdRP is useful in gene therapy, particularly for treating a disease that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid fragments encoding RNA-directed RNA polymerase useful for controlling gene expression and providing mechanisms to engineer plant virus resistance
                                                                                                                                                                                      RNA-directed RNA polymerase useful providing mechanisms to engineer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize; plant; RNA-directed RNA polymerase; gene mapping; gene marker; plant virus resistance; plant breeding.
                                                                                                                                                                                                                                                                                                                                   The present sequence is part of a plant RNA-directed RNA polymerase protein. Polynucleotides encoding RNA-directed RNA polymerases were isolated from plant CDNA libraries. They are useful as probes for genetically and physically mapping qenes, and as markers for traits linked to those genes. They are useful for controlling gene expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                       Zhong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is part of a plant RNA-directed RNA polymerase

protein. Polynucleotides encoding RNA-directed RNA polymerases were isolated from plant cDNA libraries. They are useful as probes for genetically and physically mapping genes, and as markers for traits linked to those genes. They are useful for controlling gene expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired phenotypes.

New nucleic acid molecule encoding a polypeptide having the enzymatic activity of RNA-directed RNA polymerase, for modulating gene expression and treating cancer and virus infection in human and animals

Example 7; Page 14; 34pp; English.

This sequence represents the tomato RNA-directed RNA polymerase (RdRP) immunogenic peptide P432 used to immunise rabbits and produce an RdRP-specific antibody. The invention comprises the nucleic acid and protein sequences of RdRP, the protein of the invention can catalyse in vitro transcription of short single stranded RNAs into DNA molecules, this transcription can be either primed by RNA or DNA oligonucleotides or be upprimed. The protein may have eytostatic or virucide activities. The sequences of the invention may be used in gene therapy or as an RNA directed RNA synthesis inhibitor. The RdRP cDNA sequence and a template nucleic acid molecule which causes a disease are useful for treating a disease caused by the undestred expression or overexpression of a nucleic acid molecule in a human, rat or mouse, by administering the molecules. This system can be used in the preparation of a pharmaceutical composition and for inhibiting expression of any desired gene by transferring the RdRP system to organisms that either lack a comparable mechanism or do not sufficiently

express their own RGRP. An antibody or an antagonist or inhibitor to the protein are useful for inhibiting RNA directed RNA synthesis and for ensuring stable heterologous, gene expression in transgenic organisms. The sequence is useful for probes and/or for the control of gene expression, as primers for amplification of nucleic acid molecules and additionally, nucleotide and protein sequences are useful for suppression of undestried gene expression in humans and animals. The RGRP is useful as a therapeutic agent for the control of cancer and virus infection in humans and animals and the antibody is useful for immunoprecipitation or immunolocalisation of the protein identification of polypeptides interacting with it and screening expression libraries.
                                                                                                                                                                                                                            Gaps

```

The present sequence is a tomato C-protein-specific antibody, P432 chosen for immunisation of rabbits. C-protein having RNA-directed RNA polymerase (RdRP) activity is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RdRP nucleic acid is useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or morphological changes. Transgenic plants containing RdRP nucleic acid is especially useful in plant cell or tissue cultures and in plant breading RdRP is useful in gene therapy, particularly for treating a disease that is caused by the undesirable expression or overexpression of a gene. New nucleic acid molecules encoding polypeptides with RNA-directed RNA polymerase enzymatic activity, useful in modulating gene expression in plants, humans and animals, as well as in plant cell/tissue cultures or Example 7; Column 24; 31pp; English. WPI; 2001-289830/30. plant breeding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid fragments encoding RNA-directed RNA polymerase useful for controlling gene expression and providing mechanisms to engineer plant virus resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is part of a plant RNA-directed RNA polymerase protein. Polynucleotides encoding RNA-directed RNA polymerases were isolated from plant cDNA libraries. They are useful as probes for genetically and physically mapping genes, and as markers for traits linked to those genes. They are useful for controlling gene expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired
                                                                                                                                                                                                                                                                                Maize; plant; RNA-directed RNA polymerase; gene mapping; gene marker;
plant virus resistance; plant breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This sequence represents the tomato RNA-directed RNA polymerase (RARP) immunogenic peptide P430 used to immunise rabbits and produce an RARP-specific antibody. The invention comprises the nucleic acid and and protein sequences of RARP, the protein of the invention can catalyse in vitro transcription of short single stranded RNAs into DNA molecules, this transcription can be either primed by RNA or DNA coligonicleotides correctly and protein may have cytostatic or virucide activities. The sequences of the invention may be used in gene therapy or as an RNA disease are useful for treating a disease caused by the undesired card molecule derived from a nucleic acid molecule which causes a disease are useful for treating a disease caused by the undesired expression or overexpression of a nucleic acid molecule which causes a disease are useful for treating a disease caused by the undesired expression or overexpression of a nucleic acid molecule which causes or mouse, by administering the molecules. This system can be used in the preparation of any desired gene by transferring the RARP system to corpanisms that either lack a composition and for inhibiting expression of any desired gene by transferring the RARP system to corpanisms that either lack a composition and for inhibition to the corpus system of an unit of sand expression, as primers for antibody or an antagonist or inhibitor to the corpus system of the control of gene expression of the control of gene expression of the control of gene expression of undesired gene expression in humans and animals and protein sequences are useful for subpression of undesired gene expression in humans and animals and the antibody is useful for immunoprecipitation or immunolocalisation of the protein, in humans and animals and the antibody is useful for immunoprecipitation or immunolocalisation of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
New nucleic acid molecule encoding a polypeptide having the enzymatic activity of RNA-directed RNA polymerase, for modulating gene expression and treating cancer and virus infection in human and animals .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô

This sequence represents the tomato RNA-directed RNA polymerase (RGRP) immunogenic peptide P431 used to immunise rabbits and produce an RGRP-specific antibody. The invention comprises the nucleic acid and appearances of RGRP, the protein of the invention can catalyse in protein sequences of RGRP, the protein of the invention can catalyse in vitro transcription of short single stranded RNAs into DNA molecules, this transcription of short single stranded RNAs into DNA molecules, this transcription can be either primed by RNA or DNA colgunous confides. Or be unprimed. The protein may have cytostatic or virucide activities. The sequences of the invention may be used in gene therapy or as an RNA directed RNA synthesis inhibitor. The RdRP CDNA sequence and a template conclete acid molecule derived from a nucleic acid molecule which causes a disease are useful for treating a disease caused by the undesired concerns. This system can be used in the preparation of any desired gene by transferring the RGRP system to preparation of any desired gene by transferring the RGRP system to organisms that either lack a comparable mechanism or do not sufficiently expression of any desired gene by transferring the RGRP system to organisms. The sequence is useful for inhibiting RNA directed RNA synthesis and for ensuring stable heterologous, gene expression in transgenic organisms. The sequence is useful for probes and/or for the control of gene expression of undesired gene expression in humans and animals. The RdRP is useful for mamplification of the control of cancer and virus infection in humans and animals and the antibody is useful for immunoprecipitation or immunolocalisation of the protein; denotein denotein denotein defention of immunoprecipitation or immunolocalisation of the protein in purance and entered of the control of cancer and virus infection in humans and animals and the antibody is useful for immunoprecipitation or immunolocalisation of the protein general protein and protein sequences are useful for immunose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule encoding a polypeptide having the enzymatic activity of RNA-directed RNA polymerase, for modulating gene expression and treating cancer and virus infection in human and animals -
                                                                                                                                                                                                                                 Tomato, RdRP; RNA-directed RNA polymerase; in vitro transcription; cytostatic; virucide; RNA synthesis inhibitor; antibody; immunogen; transgenic plant; transgenic animal; cancer; viral infection; immunoprecipitation; immunolocalisation; P431; gene therapy.

C-protein having RNA-directed RNA polymerase (RdRP) activity is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RARP nucleic acid is useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or morphological changes. Transpente plants containing RdRP nucleic acid is especially useful in plant cell or tissue cultures and in plant breeding. RdRP is useful in gene therapy, particularly for treating a disease that is caused by the undesirable expression or overexpression of a gene.
                                                                                                            Tomato; gene therapy; RNA-directed RNA polymerase; RdRP; gene expression; transgenic plant; tissue culture; plant breeding; therapy; C-protein; antibody; immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecules encoding polypeptides with RNA-directed RNA polymerase enzymatic activity, useful in modulating gene expression in plants, humans and animals, as well as in plant cell/tissue cultures or plant breeding
                                                                                   Tomato C-protein-specific antibody, P430 for immunisation of rabbits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                            The present sequence is a tomato C-protein-specific antibody, P431 chosen for immunisation of rabbits. C-protein having RNA-directed RNA polymerase (RARP) activity is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RARP nucleic acid is useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or especially useful in plant cell or tissue cultures and in plant breeding. RARP is useful in gene therapy, particularly for treating a disease that is caused by the undesirable expression or overexpression of a gene.

New nucleic acid fragments encoding RNA-directed RNA polymerase useful for controlling gene expression and providing mechanisms to engineer plant virus resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A new plant SGS2 gene involved in encoding an RNA-dependent RNA polymerase and in transgene silencing, increases transgene stability and expression in transgenic plants when it is inactivated \cdot
                                                                                                                                                                                                                               The present sequence is part of a plant RNA-directed RNA polymerase protein. Polymerases encoding RNA-directed RNA polymerases were isolated from plant cDNA lbraries. They are useful as probes for genetically and physically mapping genes, and as markers for traits linked to those genes. They are useful for controlling gene expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

These PCR primers are used to amplify a cDNA encoding tomato - Protein having RdRP activity. The peptide is obtained by micro-sequencing RdRP protein. C-protein is capable of RNA-directed RNA synthesis, thus using protein. C-protein is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RdRP nucleic acid is useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or morphological changes. Transgenic plants containing RdRP nucleic acid is especially useful in plant cell or tissue cultures and in plant breeding. RdRP is useful in gene therapy, particularly for treating a disease that is caused by the undesirable expression or overexpression of a gene.
The present sequence represents a plant SGS2 polypeptide. SGS2 is an RNA-dependent RNA polymerase and is involved in transgene silencing. Inactivation of SGS2 is used to increase transgene stability and expression in plants, particularly crop plants, especially maize, corn, barley, sorghum, soya, sugar cane, beet, tobacco or cotton plants. Overexpression of SGS2 can be used to increase resistance to viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecules encoding polypeptides with RNA-directed RNA polymerase enzymatic activity, useful in modulating gene expression in plants, humans and animals, as well as in plant cell/tissue cultures or

This sequence represents the tomato RNA-directed RNA polymerase (RdRP) immunogenic peptide P433 used to immunise rabbits and produce an RdRP-specific antibody. The invention comprises the nucleic acid and protein sequences of RdRP, the protein of the invention can catalyse in vitro transcription of short single stranded RNAs into DNA molecules, this transcription can be either primed by RNA or DNA oligonucleotides or be unprimed. The protein may have cytostatic or virucide activities. The sequences of the invention may be used in gene therapy or as an RNA disease are useful for treating a disease caused by the undesired a disease are useful for treating a disease caused by the undesired a disease are useful for treating a disease caused by the undesired cypression of an overexpression of an uncleic acid molecule which causes a disease are useful for treating the molecules. This system can be used in the preparation of any desired gene by transferring the RdRP system to cyanisms that either lack a composition and for inhibition to the expression of any desired gene by transferring the RdRP system to cyanisms that either lack a comparable mechanism or do not sufficiently expression of any desired gene by transferring the RdRP system to cyanisms. The sequence is useful for inhibiting RNA directed RNA synthesis and for ensuring stable heterologous, gene expression in transgent organisms. The sequence is useful for impulsitionally, nucleotide and protein sequences are useful for sapility, nucleotide and protein sequences are useful for sapility, nucleotide and protein sequences are useful for supplication of sequences are useful for supplication of the control of gene expression in humans and animals and the animals and the multipody is useful for infinitionally, indectide and protein sequences are useful for infinitionally indectide and protein sequences are useful for infinitely and the sequence is useful as a therapeutic agent for the control of cancer and virus infection in humans and animals and animals an enti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid molecule encoding a polypeptide having the enzymatic activity of RNA-directed RNA polymerase, for modulating gene expression and treating cancer and virus infection in human and animals -

New nucleic acid fragments encoding RNA-directed RNA polymerase useful for controlling gene expression and providing mechanisms to engineer plant virus resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is part of a plant RNA-directed RNA polymerase protein. Polymerases encoding RNA-directed RNA polymerases were isolated from plant cDNA libraries. They are useful as probes for genetically and physically mapping genes, and as markers for traits linked to those genes. They are useful for controlling gene expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired
                                                                                                                                                                                              plant; RNA-directed RNA polymerase; gene mapping; gene marker; virus resistance; plant breeding.
                                                                                                                                                        Rice RNA-directed RNA polymerase, SEQ ID NO: 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 10; Page 46-49; 62pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a tomato C-protein-specific antibody, P433 chosen for Immunisation of rabbles. C-protein having RNA-directed RNA polymerase (RdRP) activity is capable of RNA-directed RNA synthesis, thus using RNA as a template for synthesising complementary RNA molecules. RdRP nucleic acid is useful for modulating gene expression in plants, humans and animals. This may lead to various physiological, developmental and/or morphological changes. Transgenic plants containing RdRP nucleic acid is especially useful in plant cell or tissue cultures and in plant breeding. RdRP is useful in gene therapy, particularly for treating a disease that is caused by the undesirable expression or overexpression of a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene therapy; RNA-directed RNA polymerase; RdRP; gene expression; it plant; tissue culture; plant breeding; therapy; C-protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecules encoding polypeptides with RNA-directed RNA polymerase enzymatic activity, useful in modulating gene expression in plants, humans and animals, as well as in plant cell/tissue cultures or
of polypeptides interacting with it and screening expression libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mannomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                          The present sequence is part of a plant RNA-directed RNA polymerase protein. Polymuclectides encoding RNA-directed RNA polymerases were isolated from plant cDNA libraries. They are useful as probes for genetically and physically mapping genes, and as markers for traits linked to those genes. They are useful for controlling gene expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired
for controlling gene expression and providing mechanisms to engineer plant virus resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

                                                                                                                                                                                                                                                                                  RNA-directed RNA polymerase useful providing mechanisms to engineer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid fragments encoding RNA-directed RNA polymerase useful
                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is part of a plant RNA-directed RNA polymerase protein. Polymucleotides encoding RNA-directed RNA polymerases were isolated from plant cDNA libraries. They are useful as probes for genetically and physically mapping genes, and as markers for trafts linked to those genes. They are useful for controlling expression and provide mechanisms to engineer plant virus resistance. They are also useful for plant breeding to develop lines with desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Zhong

                                                                                                                                                                                                                                                                                                       Corn; histidine biosynthetic enzyme; HisA; clone p0085.cscail9r; phosphoribosylformimino-5-aminoimidazole carboxamide.ribotide isomerase; herbicide; fungicide.
treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a phosphoribosylformimino-5-
aminoimidazole carboxamide ribotide isomerase (HisA) which is a
histidine biosynthetic enzyme. The sequence is derived from
p0085.cscailyr clone isolated from a corn shoot culture cDNA library
p0085. The present sequence is useful in altering the
levels of HisA enzyme in transformed plant cells.
It may also be used for discovering compounds that have the ability
to inhibit activity of the isomerase, and therefore act as herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to the isolation of novel DNA-binding proteins, and cDNA (AAS29030-AAS29157) and genomic sequences encoding proteins and cDNA (AAS29030-AAS29157) and genomic sequences encoding for these proteins action modifier) domain proteins, and Y-box binding proteins may contribute to diseases resulting from aberrant DNA organisation and/or gene transcription. The sequences of the invention are useful in screening assays to identify antagonists and/or agonists chat may enhance or block activities mediated by DNA-binding proteins. Blockers of DNA-binding proteins may be useful in treating disorders cauch as mailginant diseases (e.g. cancer), autoimmune disorders cauch as mailginant diseases (e.g. cancer), autoimmune disorders city arthitis), genetic abnormalities (e.g. cystic fibrosis), infectious diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's diseases). The polynucleotide sequences of the invention may also be used in gene therapy. AAU18154-AAU18281 represent novel DNA-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecules encoding human secreted chromosomal binding proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.7%; Score 8; DB 22; Length 283;

The present sequence represents human Vpr interacting protein (hVIP). DNA encoding hVIP can be used to transform host cells to express the protein. Sequences complementary to the DNA can be used in methods for inhibiting expression of hVIP, treating an individual who has cancer, and for inhibiting hVIP activity in a cell. The hVIP can also be used to treat hyperproliferative diseases and some autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents human vpr interacting protein (hVIP). DNA encoding hVIP can be used to transform host cells to express the protein. Sequences complementary to the DNA can be used in methods for inhibiting expression of hVIP, treating an individual who has cancer, and for inhibiting hVIP activity in a cell. The hVIP can also be used to treat hyperproliferative diseases and some autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a phosphoribosylformimino-5-
aminoimidazole carboxamide ribotide isomerase (HisA) which is a
histidine biosynthetic enzyme. The sequence is derived from
wheln.pk0018.bi0 clone isolated from a wheat leaf cDNA library wleln.
The present sequence is useful in altering the
levels of HisA enzyme in transformed plant cells.
It may also be used for discovering compounds that have the ability
to inhibit activity of the isomerase, and therefore act as herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                      Phosphoribosylformimino-5-aminoimidazole carboxamide ribotide isomerase, polypeptide (P), useful for discovering compounds which inhibit isomerase activity and act as herbicides and fungicides -

```
isoprenoids. More particularly the invention provides isolated nucleic acids, substantially pure polypeptides, host cells, and methods for the production stoprenoid compounds. The polypeptides are useful for the production of isoprenoids, especially COQ(10). Expressing the pure polypeptides, which has 1-deoxyxylulose-5-phosphate synthase (DKS) activity or decaprenyl diphosphate synthase (DDS) activity, is useful for increasing production of COQ(10) in a cell having endogenous DDS activity. This sequence represents a protein relating to the isoprenoid production of the invention.
                                                                                                                Isoprenoid; CoQ(10); 1-deoxyxylulose-5-phosphate synthase; DXS; DDS;
decaprenyl diphosphate synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to methods and materials for the production of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecules encoding human secreted chromosomal binding proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of novel DNA-binding proteins, and cDNA (AAS29030-AAS29157) and genomic sequences encoding for these proteins. DNA-binding proteins such as histones, chromo chromatin organisation modifier) domain proteins, and Y-box binding proteins may contribute to diseases resulting from aberrant DNA organisation and/or gene transcription. The sequences of the invention are useful in screening assays to identify antagonists and/or agonists that may enhance or block activities mediated by DNA-binding proteins. Blockers of DNA-binding proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         such as malignant diseases (e.g. cancer), autoimmune disorders (e.g. diabetes mellitus), rheumatic diseases (e.g. rheumatoid arthritis), genetic abnormalities (e.g. cystic fibrosis), infectious diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's disease). The polynucleotide sequences of the invention may also be used in gene therapy. AAU18154-AAU18281 represent novel DNA-binding

                                                                                                                                                                                                                                                                                                                                                             염
                                                                                                                                                                                                                                                                                         δ
                                                                                                                                                                                                                                                                                        ö
                                                                                                                                            The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an B-value sequences are actor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                            Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to isolated polynucleotide (I) and probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The charter is a series of (II). The polymerating expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving constituting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymenteotide sequences have applications in dispnostics, forensics, gene mapping, identification of mutations in to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human of agenemic data for this patent did not appear in the printed sequence the types of the invention.

Note: The sequence data for this patent did not appear in the printed sequence in the printed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess blodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disconders involving aberrant protein expression or biological activity. The polypetide and polymucleotide sequences have applications in dispnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amno acid sequences. ABG00010-ABG30377 represent novel human classes and each act his patent did not appear in the printed and or this patent did not appear in the printed act fill and in the printed and or this patent did not appear in the printed are the file and product former the act has sequenced and the printed and product former the act has patent did not appear in the printed are file and products former than a product and and appear and act has a part of a product former than a product and and appear and a product and a printed and and appear and a product and and appear and a product and a product and a product and a printed and and appear and an activity and and appear and act and act has a person and act and act and a person and act and act has a perso

polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving cartivity of (II) or to treat disease states involving cartivity of (II) or to treat disease states involving a food supplement. (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and the produce cate and sequences of the invention.

Note: The sequence data for this patent did not appear in the printed are the print of the pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
      (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbarrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the very sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; chromosome mapping; gene mapping; gene therapy; forensic;

                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for identifying expressed genes. (I) is useful in gene therapy techniques

(II) is useful for generating antibodies against it, detecting or

(II) is useful for generating antibodies against it, detecting or

quantitating a polypeptide in tissue, as molecular weight markers and as

a food supplement. (II) and its binding partners are useful in medical

imaging of sites expressing (II). (I) and (II) are useful for treating

disorders involving aberrant protein expression or biological activity.

The polypeptide and polymucleotide sequences have applications in

The polypeptide and polymucleotide sequences have applications in

The polypeptide of genetic disorders or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and

amino acid sequences. ABG00010-ABG30377 represent novel human

Mote: The sequence data for this patent did not appear in the printed

specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and bolypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) and (II) and (II) are useful for treating
a food supplement. (II) and its binding partners are useful in medical imaging of sites expression (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerses chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for estore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating discorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to asses biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human happened as sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
